## Fractional Skyscrapers by Robert Vollmert

### Theme: Logical

Rules: Variation of Skyscrapers. Place a digit from 1 to 6 into each cell (including one digit in each half of the split cells) so that no digit repeats in any row or column. The building heights in the split cells are evaluated as fractions (e.g.  $5/2 = 2.5$ ) when considering their heights. A building hides all other buildings behind it that are the same height or lower in height.
