

2018/11/24:
 Nurikabe Loop by Murat Can Tonta
 Theme: Primes

Rules: In this variation of Nurikabe, the no 2x2 ocean rule is removed and instead all ocean cells must belong to a single closed loop. Specifically:
 Divide the grid into regions called “islands”, each containing exactly one of the given numbers and with the same area as that number. Islands can only touch diagonally. A single closed loop (without intersection or crossings) must be drawn in all remaining cells.
